TESTIMONY OF THE INTERNATIONAL DAIRY FOODS ASSOCIATION WITH RESPECT TO PROPOSALS 19
2023 FEDERAL MILK ORDER HEARINGS
DOCKET NO. 23-J-0067; AMS-DA-0031

This testimony is submitted on behalf of the International Dairy Foods Association (IDFA) with respect to Proposal 19, which would materially increase current Class I differentials.

IDFA represents the nation's dairy manufacturing and marketing industry, which supports more than 3.2 million jobs that generate $49 billion in direct wages and $794 billion in overall economic impact. IDFA's diverse membership ranges from multinational organizations to single-plant companies, from dairy companies and cooperatives to food retailers and suppliers, all on the cutting edge of innovation and sustainable business practices. Together, they represent most of the milk, cheese, ice cream, yogurt and cultured products, and dairy ingredients produced and marketed in the United States and sold throughout the world.

As buyers and processors of milk, the members of IDFA have a critical interest in these hearings. Most of the milk bought and handled by IDFA members is purchased under the Federal milk marketing orders promulgated pursuant to the Agricultural Marketing Agreement Act of 1937 (the "AMAA").

I am Mike Brown, Chief Economist for IDFA since January 2023. I have testified on other proposals earlier in this hearing, and at that time described my professional and educational background. My testimony now will address the multiple reasons why USDA should reject NMPF Proposal 19.

1. The current milk supply is far more than adequate to serve Class I needs. The fundamental purpose of the federal order system is to attract an adequate supply of

milk to meet fluid needs, thus achieving orderly marketing, and then share the proceeds of minimum regulated prices among all pooled dairy farmers. The AMAA explicitly references the need "to insure a sufficient quantity of pure and wholesome milk," which has consistently been interpreted by USDA to refer to milk for fluid consumption. See January 31, 2003 letter from USDA AMS Deputy Director for Dairy Programs to Congressman Sherwood listing as the first objective of the FMMO program "to assure an adequate supply of milk for the fluid market…" (Attachment A to this testimony); see also USDA, Milk in the New England and Other Marketing Areas; Decision on Proposed Amendments to Marketing Agreements and to Orders, 64 FR 16026,16102 (Apr. 2, 1999). ("the purpose of the minimum Class I differential is to generate enough revenue to assure that the fluid market is adequately supplied.").

This interpretation of the AMAA requirement is confirmed by USDA's focus in assessing the adequacy of the milk supply based on whether the milk being used for non-fluid needs is sufficiently large to serve as a "reserve supply" for fluid purposes, which I will now address. USDA has recently reiterated that "Ensuring Class I demand is met is essential to the FMMO system in meeting its objective of maintaining orderly marketing conditions." Milk in the Appalachian, Florida, and Southeast Marketing Areas; Recommended Decision on Proposed Amendments to Marketing Agreements and to Orders, 88 Federal Register 46016, 46028 (July 18, 2023).

a. There is a much more than sufficient reserve supply. It has long been recognized that temporal fluctuations in, and incongruity between, milk production and fluid milk consumption require a sufficient "reserve supply" of milk serving non-fluid milk needs in order to ensure an adequate supply of milk to serve fluid needs. USDA

previously assessed at some length how large such a reserve supply is needed and concluded that the reserve supply is adequate if it comprises at least 30-35% of an order's milk total supply. AS USDA explained:

> The record indicates that in order to serve the varying needs of a Class I market on a year-round basis, reserve milk supplies equal to about 30 percent of the total milk in the market are needed. The views on this point varied from 15 percent to 40 percent, with a fairly persuasive argument for at least 30 percent. Thus, a reserve milk supply equal to 30 to 35 percent of the total milk in the market appears to be a reasonable reserve requirement. Milk in the New England and Other Marketing Areas; Decision on Proposed Amendments to Tentative Marketing Agreements and Orders, 58 FR 12634, 12646 (March 5, 1993).[1]

The simple but inescapable and striking truth is that the current supply of milk greatly exceeds, by any measure, the amount necessary to satisfy fluid needs. There is no justification to increase Class I differentials and stimulating a larger milk supply given the presence of an already far more than adequate milk supply.

Indeed, USDA has long recognized that "[b]ecause some milk is produced just about everywhere, a Class I differential needs only to be high enough to bring forth enough milk—'local' and milk from alternative and more distant supply areas—at any location to meet Class I demand…. At all locations, the Class I differential value needs to represent a reasonable sum of such factors that, taken as a whole, accomplish the goal of assuring an adequate supply of milk to meet demands."" USDA, Milk in the New England and Other Marketing Areas; Proposed Rule on Proposed Amendments to

[1] In order reform, USDA assumed, without resolving, similar numbers, i.e., "that markets with Class I use equal to or below 70 percent have an adequate reserve supply of milk to meet fluid needs and that markets with Class I use about 70 percent require additional milk supplies to meet fluid demand." USDA, Milk in the New England and Other Marketing Areas; Proposed Rule on Proposed Amendments to Marketing Agreements and to Orders, 63 Federal Register 4802, 4823 (Jan. 30,1998).

Marketing Agreements and to Orders, 63 Federal Register 4802, 4896 (Jan. 30, 1998). "The purpose of the minimum Class I differential is to generate enough revenue to assure that the fluid market is adequately supplied." USDA, Milk in the New England and Other Marketing Areas; Decision on Proposed Amendments to Marketing Agreements and to Orders, 64 FR 16026,16102 (Apr. 2, 1999).

b. Class I utilization is low and has been in a consistent decline for many years. Given the current abundant milk supply in nearly all orders, there is no justification to increase the current Class I differentials.

On a national basis, Class I utilization in 2022 was only 27% of pooled milk. USDA, Market Summary and Utilization 2022 Annual Report at p. 2, available at https://www.ams.usda.gov/sites/default/files/media/2022AnnualPriceandPoolReport.pdf. Thus, a full 73% of total milk pooled fell into the "reserve supply" category. This is more than twice the 30-35% supply reserve that USDA deemed to constitute a "reasonable reserve."

The only orders at or below the 30-35% level are the three Southeastern orders, and as I will explain later, the special transportation and delivery credits recently adopted in these orders, for the specific purpose of encouraging the supply of Class I milk to those three orders, eliminate any need to raise Class I differentials there.

It is, indeed, remarkable how far we have come. In 1947, Class I milk represented about two thirds of regulated milk. Today, as noted, it is only 27% of federally regulated milk, and only 18% of all milk (40,986 million pounds of milk pooled in Class I, see Market Summary and Utilization 2022 Annual Report at p. 1, available at https://www.ams.usda.gov/sites/default/files/media/2022AnnualPriceandPoolReport.pdf,

divided by 226,462 million pounds of milk produced, see NASS, Milk Cows and Production by Quarter United States: 2022-2023, available at Milk Production | National | September 2023 | National Agricultural Statistics Service (usda.gov).

There is simply no basis to increase Class I differentials, to meet the statutory purpose of securing an adequate supply of milk for Class I needs, when the milk supply is ***more than five times higher*** than the amount necessary to satisfy fluid milk needs. More than 99% of that milk is Grade A see USDA NASS, Milk Production, Disposition, and Income 2022 Summary (April 27, 2023) at p. 11, available at Publication | Milk Production, Disposition, and Income Annual Summary | ID: 4b29b5974 | USDA Economics, Statistics and Market Information System (cornell.edu)., and thus qualified for Class I use.

c. Class I processors have been able to obtain a sufficient supply. As I have testified previously, I led from 2015 through early 2023 the milk and dairy procurement team for The Kroger Co., one of the country's largest supermarket operators by revenue, as Director of Dairy Supply Chain. In addition to being a retailer, Kroger operates 15 Company-owned dairy plants, as well as 2 cheese packaging plants. As Director of Dairy Supply Chain, I was responsible for a four-member team buying all raw dairy materials for all 17 plants, as well as for buying Kroger-branded dairy products co-packed for Kroger by third parties.

I can state with confidence and from personal experience that there was never an occasion during those more than seven years when I found myself unable to secure sufficient farmer milk to meet Kroger's Class I processing needs. The necessary supply

was always there. And this includes the four Kroger plants located in the Southeastern Orders, which are located in Virginia, Georgia, Tennessee and Kentucky.

d. The consistent decline in shipping requirements confirms the adequacy of the milk supply for Class I needs. The adequacy of the current milk supply to meet Class I needs is further established by the history of adjustments to federal order shipping requirements, i.e., the percentage of its milk a supplier must ship for Class I use in order to qualify for pooling on the order. A USDA hearing exhibit reveals that since 2010, not a single federal milk order has increased that percentage. Rather, at the behest of suppliers, the requisite Class I shipping percentage was during that time period lowered, not raised, in Orders 1, 30, 33, 124, and 131. Hearing Exh. 39, p. 1.

This phenomenon can only be attributed to the degree to which the milk supply is increasingly more than adequate to serve Class I needs. Relatedly, USDA during that time period never once was asked to direct that any milk shipments be made to a Class I plant: "No order received any call for or had any issuance of milk to be shipped to Class I plants in their order." Id.

2. When a consumer product like fluid milk is suffering continuing, massive sales declines, materially raising its price makes no sense. The notion that the price for milk going to fluid use should be raised so that, once blended with the price of milk for other purposes, farmers will reap a financial benefit, no longer matches reality.

The numbers are truly disheartening. On a total gallons basis, national fluid milk sales have fallen over 21% from their peak of 55,165 million pounds in 1991 to only 43,448 million pounds in 2022. USDA ERC Fluid Beverage Milk Sales Quantities By Product (Annual), available at USDA ERS - Dairy Data.

But even those discouraging numbers mask the true decline, because the United States' population grew significantly those years. On a per capita basis, which is a truer measure of demand, annual per capita fluid milk consumption fell from 247 pounds in 1975, to 218 pounds in 1991, to 134 pounds in 2021. USDA ERC Dairy Products: Per Capita Consumption, United States (Annual), available at USDA ERS - Dairy Data. Thus, per capita fluid milk consumption fell by a massive 45% over this time frame. Per capita pounds then fell from 134 pounds in 2021 to 130 pounds in 2022, an additional 3% decline in a single year. USDA ERS Dairy Products per Capita Consumption, United States, available at https://www.ers.usda.gov/data-products/dairy-data.

I am not suggesting that these steady, regrettable declines are entirely attributable to price. But I ***am*** strongly contending that choosing to impose by government edict a very material price increase on a product suffering these sales declines would be unthinkable to anyone making ordinary pricing decisions in the retail marketplace. I cannot recall a single example where Kroger behaved in this manner with respect to any product during the more than eight years I worked there.

3. Dr. Capps' and other recent price elasticity studies firmly establish that Class I differentials should not be raised. Even if viewed solely based upon the effect on dairy farmers, increasing Class I differentials is completely misguided if the concomitant retail price increase so diminishes Class I product sales that they largely if not entirely offset the higher Class I price. That is precisely what Dr. Capps' elasticity study and related work demonstrate will happen if Proposal 19 is adopted.

Once upon a time, fluid milk may well have been relatively price inelastic, and it might have been possible to increase Class I minimum prices without creating a severe offsetting decline in fluid milk sales. Certain (but not all) earlier studies so indicated.

But the Capps report, as well as the two other 2023 studies by other experts that Dr. Capps cites, definitively demonstrate this is no longer true. Readers should consult Dr. Capps' report for a detailed discussion of methodology and results, Hearing Exhibits 386 and 387. The bottom line conclusions are straightforward:

a. The retail demand for fluid milk products is elastic, not inelastic. Demand for a product is deemed elastic if a 1% increase in price would result in more than a 1% decrease in sales. Dr. Capps study dove deeply into that issue, and examined it from clearly the appropriate perspective, based upon weekly sales data that reflect the frequency with which the average consumer actually purchases milk, and based upon the many competitive products milk faces in the current marketplace, including the fast growing variety of plant-based beverages (almond, oat, cashew, coconut, rice, and soy), bottled water, refrigerated juices and drinks as well as shelf-stable bottled juices, sports drinks, refrigerated yogurt, and protein beverages. The own-price elasticities at retail during the current, post-Covid period were shown to be:

CATEGORY	ELASTICITY		
Total Milk	-1.26		
Traditional White Milk	-1.40	Organic Milk	-1.73
Health-Enhanced Milk:	-2.05		
Lactose-Free Milk	-1.68		
Traditional Flavored Milk:	-0.58		

Thus, for example, a 1% increase in the price of total milk will result in a 1.26% decline in total retail milk sales.

b. The proposed increase in the Class I differential will precipitate a substantial decline in Class I product sales and result in a material decline in farmer receipts. Dr. Capps also calculated the percentage increase in fluid milk product prices resulting from Proposal 19's $1.49/cwt increase in the Class I differential, and the resultant declines in retail fluid milk product sales, based on the elasticities his study had established. The sales declines were quite startling:

CATEGORY	DECLINE IN SALES
Total Milk:	5.98%
Traditional White Milk:	6.28%
Organic Milk:	4.11%
Health-Enhanced Milk:	5.67%
Lactose-Free Milk:	2.75%
Traditional Flavored Milk:	2.40%

Thus, Proposal 19's 1.49/cwt increase in the Class I differential, which represents an 8.6% increase in the Class I price, would cause a 5.98% decline in total retail fluid milk sales.[2]

c. Dr. Capps' analysis only addressed the effect of Proposal 19 and therefore understates the decline in fluid milk sales that would result from the NMPF proposals. Dr. Capps' analysis demonstrates that the 8.6% increase in Class I prices that Dr. Kaiser indicated would result from the NMPF proposal would result in a 4.72% increase in the price of fluid milk products and a nearly 5.98% decline in the quantity purchased at retail. See Hearing Exhibits 386 and 387. But even that substantial decline

[2] During Dr. Capps' cross examination, one of the questioners requested a copy of the relevant excerpts of the Price Consulting study upon which Dr. Capps relied to determine the percentages of milk products sold at retail outlets, schools, and food service. Those excerpts appear in Attachment B to this testimony.

is understated, because Dr. Kaiser was explicit that the 8.6% Class I price increase he was calculating ***only*** addressed the price increase resulting from Proposal 19, the NMPF proposal to increase the Class I differentials. As Dr. Kaiser stated on page 3 of his written testimony, Hearing Exhibit 115: "NMPF's proposal recommends a nationwide increase of the Class I price differential by an average of $1.49 per cwt. At current Class I prices, this is an 8.6% increase."

But Proposal 19 is not the only NMPF proposal designed to increase Class I prices. Although there are others as well, I will focus here on Proposal 1. As I established in my written testimony, see Hearing Exh. 98 at pp. 30-39 (IDFA Exh. 4), Proposal 1's changes to the milk component factors in the federal order pricing formulas would increase Class I minimum regulated prices by an additional $0.52/cwt.

Given Dr. Kaiser's analysis that Proposal 19's $1.49/cwt increase in the Class I differential represents an 8.6% increase in the Class I price, Proposal 1's additional $0.57/cwt increase in the Class I price represents an additional 3.0% increase in Class I prices. Applying Dr. Kaiser's 0.55% elasticity of price transmission from the farm level to the retail level, this additional 3.0% increase in the Class I price translates to an additional 1.65% increase in the retail price of total fluid milk products. Applying Dr. Capps' determination that the own-price elasticity for total fluid milk at retail is -1.26 in the moving-past COVID period, this means that Proposal 1 would result in an additional 2.08% decline in total retail milk sales, on top of the 5.98% decline calculated by Dr. Capps as caused by Proposal 19's Class I differentials increases.

Given that the federal order program is designed to foster and encourage fluid milk consumption, reflecting the wholesome, nutritious nature of the product, especially for children, such a regulatorily-mandated outcome should be anathematic.

That is true based solely upon the impacts I have just described. But there is another negative impact to consider. The more than material 6% decline in retail fluid milk sales resulting from the proposed increase in Class I differentials will leave many millions of gallons of farmer milk without a home.

4. Proposal 19 would significantly increase government program costs.

The $1.49/cwt increase in Class I differentials would cost the Government over $67 million, assuming direct pass through:

Estimated Impacts of Federal Government Direct Purchases of Beverage Milk

	School Breakfast & Lunch	Daycare + Preschool	Food Banks + USDA	Military	Totals
Total Gallons Milk (Millions)	403	24	38	23	488
Total Pounds Milk (Millions)	3,474	207	328	198	4,207
Total Cwt Used (Millions)	34.7	2.1	3.3	2.0	42.1
Average Differential Increase / Cwt	$1.49	$1.49	$1.49	$1.49	$1.49
Total Milk Cost Increase (Million $)	$51.8	$3.1	$4.9	$3.0	$62.7

5. Proposal 19 should be rejected because it reflects an ill-conceived amalgamation of disparate, unevenly applied criteria, many of which bear no relevance to Class I pricing and have never played a role in setting Class I differentials.

Proponents of federal order amendments have an obligation to present a coherent, cohesive justification for their proposals. Proposal 19's proposed Class I differential map

falls far short. Other witnesses will address specific infirmities in the specific proposed new differentials. I will take a small step back and discuss systemic deficiencies in the approach taken.

Let me start by briefly summarizing USDA's consistent approach toward setting Class I differentials, because the testimony in support of Proposal 19 often contradicts fundamental principles for setting Class I prices and differentials As I have already addressed in earlier testimony, it has been USDA's consistent position that the ***general costs*** of producing milk – that is, the costs of producing milk that are not tied specifically to the costs of producing milk for Class I purposes – are captured by the normal operation of supply and demand in the marketplace. "[T]he costs of producing milk are reflected in the supply and demand conditions for the dairy products." Milk in the Northeast and Other Marketing Areas; Tentative Partial Final Decision on Proposed Amendments and Opportunity To File Written Exceptions to Tentative Marketing Agreements and Orders, 73 Federal Register 35,305, 35,324 (June 20, 2008).

Furthermore, these general costs of producing milk are captured through the regulated minimum prices for milk being used for Class III and IV products. "In the aggregate, the costs of producing milk are reflected in the supply and demand conditions for the dairy products. When the supply of milk is insufficient to meet the demand for Class III and Class IV products, the prices for these products increase as do regulated minimum milk prices paid to dairy farmers because the milk is more valuable, and this greater milk value is captured in the pricing formulas." Id.

The Class I price has been established by adding on top of the Class III and IV price adjustments unique to Class I. This is comprised of two elements, the first being a

base differential, currently $1.60, which historically has been made up of the cost of obtaining and maintaining a Grade A supply (although as I will show later in this testimony that factor is no longer appropriate for inclusion); any special balancing costs attendant to serving Class I processors; and a portion of the actual competitive costs incurred by fluid plants to simply compete with manufacturing plants for a supply of milk.[3]

Added to the base differential is a location differential reflecting some of the costs of moving milk from areas of production to Class I processing facilities. USDA, Milk in the New England and Other Marketing Areas; Decision on Proposed Amendments to Marketing Agreements and to Orders, 64 FR 16026, 16112 et seq. (Apr. 2, 1999).

USDA has also recognized that the price elasticity of Class I products may provide an additional limitation on Class I prices. USDA, Milk in the New England and Other

---

[3] USDA explained this approach as follows during order reform:

“”Option 1A [which was ultimately adopted] utilizes $1.60 as the minimum price in the three base zones. Currently, the lowest differential in Federal orders is $1.04 ($1.20 in Minneapolis) in the Upper Midwest order. A review of current marketing practices has revealed that the $1.04 per hundredweight base zone differential may not be established at a level high enough to ensure adequate milk supplies for fluid use. First, a portion of the Class I differential must reflect the value associated with maintaining Grade A milk supplies since this is the only milk available for fluid use….It has been estimated that this value may be worth approximately $0.40 per hundredweight. Traditionally, the additional portion of the Class I differential reflects the marketing costs incurred in supplying the Class I market. These marketing costs include such things as seasonal and daily reserve balancing of milk supplies, transportation to more distant processing plants, shrinkage, administrative costs, and opportunity or “give-up” charges at manufacturing milk plants that service the fluid Class I markets. This value has typically represented approximately $0.60 per hundredweight…. Option 1A establishes an additional competitive factor into the development of the base zone Class I differential. Option 1A values this competitive factor to be worth about $0.60 per hundredweight. This value reflects approximately two-thirds of the actual competitive costs incurred by fluid plants to simply compete with manufacturing plants for a supply of milk.” USDA, Milk in the New England and Other Marketing Areas; Proposed Rule on Proposed Amendments to Marketing Agreements and to Orders, 63 Federal Register 4802, 4908-09 (Jan. 30,1998).

Marketing Areas; Decision on Proposed Amendments to Marketing Agreements and to Orders, Id at 16102. At that time, USDA viewed Class I price increases appropriate given its then-view that the demand for fluid milk products was price "inelastic." Id. That conclusion is no longer valid, as I will discuss later; but for present purposes, I will focus on the historic criteria.

The University of Wisconsin U.S. Dairy Sector Simulator (USDSS) study submitted in this proceeding did not address the base differential, but rather looked at location differentials by addressing e.g., the costs of moving milk from supply areas to processing facilities. See Exhs. 300 and 301 for a county-by-county summary of its conclusions. The study did not consider the own-price elasticity of finished products and thus did not address the impact of any proposed price increases on demand for fluid milk products.

Proposal 19 purports to endorse that USDSS model, but it in fact proposes numerous and often quite substantial revisions to its results. See Exhs. 300 and 301. The rationales advanced by the proponent witnesses were frequently contradictory and often had no bearing whatsoever on the considerations USDA has identified as relevant to setting Class I prices. I will not purport to provide an exhaustive review, but the examples I will provide suffice to make my point.

i. The costs of producing milk in general. Professor Stephen Koontz devoted his entire testimony to the costs to produce milk in Colorado and as compared to other states, including the costs of corn and alfalfa and the costs of transporting that feed to Colorado, profitability of milk production in the state, the costs and availability of irrigation water, and the like. Hearing Exh. 304. All of this relates to the costs of dairy production

in general.; None relates to any special costs of producing milk for Class I purposes, and as I have shown, none of these kinds of general costs have been considered by USDA in setting Class I differentials themselves.

This kind of broad and ultimately irrelevant testimony has been repeated over and over and over by the proponents. Additional examples include the testimony of witness Jensen (Hearing Exh. 334) at p. 1 (I was "asked to provide data on corn basis, soybean meal basis, and DDG (Dried Distillers grains) price delivered into Colorado and California"); witness Butcher (Hearing Exh. 376) at pp. 3-5 (the costs of water and the effect of drought, worker housing and farmland costs in Arizona).

To be sure, one witness, Mr. Erba, did address the supposedly special costs of producing milk for Class I purposes, by addressing the costs of producing Grade A milk versus Grade B milk. Hearing Exhibit 336. For the reasons I will explain later in this testimony, developments over the last 25 years have rendered inapt the previous focus of Grade A versus Grade B as a fluid milk versus manufacturing milk issue; and Mr. Erba's cost figures are in any event highly inflated, especially when the only question now is the cost of ***maintaining*** Grade A status for the over 99% of milk that has already ***attained*** Grade A status.

But Mr. Erba's testimony is at least potentially relevant to the issue at hand and to USDA's practices in setting Class I differentials. Unless the proponents of Proposal 19 are supporting a radical change in how USDA goes about determining Class I differentials – and there has been no evidentiary and economics-based support for such a radical change—the bulk of the testimony submitted is simply irrelevant. Such a radical change

would be especially fraught given the much more than adequate current milk supply to serve the country's Class I needs, as I have discussed earlier in this testimony.

ii. Regional competition in the sale of manufactured products. Witness Vandenheuvel (Hearing Exhibit 345, at pp. 2-3) insisted that Class I differentials need to reflect regional competition at the farm level and insisted that California (with its low Class I utilization) needed to have Class I differentials such that the blend price in California was similar to the blend price in the Upper Midwest. While acknowledging that "virtually no milk moves between California's milk supply region of the Central Valley and the Upper Midwest milksheds of Wisconsin, Minnesota and South Dakota," he argued that "these regions have some functional similarities," and that the "on-farm competitiveness of similar regions across the U.S. is not something the USDSS model is designed to solve for, but it is an important factor for USDA and the industry to consider." Id. In other words, Mr. Vandenheuvel contends that Class I differentials need have nothing to do with any special costs of producing milk for fluid needs or serving Class I facilities but should be set based upon the competitive relationship between regions 1500 miles apart with respect to the sale of ***manufactured*** milk *pr*oducts.

The same propositions were advanced by witness Schilter (Hearing Exh. 397) at p. 2 ('Regional competitiveness at the farm level needs to be maintained in areas and regions similar to each other across the United States").

No such concept has previously been adopted by USDA with respect to the setting of Class I differentials. Indeed, these proponents' focus on competition for manufactured products for purposes of setting Class I differentials is the exact opposite of the federal

order system's focus on setting Class I differentials based on the needs to secure the supply for Class I milk.

Moreover, USDA long ago determined that it would set one manufacturing price per manufacturing class, which would apply uniformly across the country. As the Department of Agriculture observed when it first adopted the "basic formula price" in 36 orders, "[p]roducer groups and handlers generally supported the adoption of a uniform basic formula for all the orders," because "a single basic formula price in all the orders would provide a desirable basis for price alignment among the several orders," which would overcome "a serious problem" of price misalignment among the orders. 27 Fed. Reg. 1802, 1803 (Feb. 27, 1962). .At the same time, the Class I differentials that would be added to those manufacturing prices to set the Class I price varied considerably, based upon each location's need to move milk from other areas. Blend prices among orders necessarily did not align.

iii. The milk supply for manufacturing plants. Other witnesses supported higher Class I differentials in specific locations because their cooperative had contractually committed to sell most of its milk to a large Class III cheese plant and a higher differential was needed to attract additional milk to serve Class I customers. Stout (Hearing Exh. 403) at pp. 9-10. While we are pleased that this IDFA cheese member secured a reliable milk supply by mutual agreement with their cooperative supplier, we have not (nor historically has USDA) seen this as a basis to increase ***via a federal legal mandate*** the amount Class I members in the order would otherwise have to pay for their milk supply.

iv. Establishing differentials to retain blend price levels in areas with limited Class I needs. Two witnesses (Hoeger, Hearing Exh. 352 at p. 7, and Werme) discussed the need to discourage milk from moving from Minnesota and Maine, respectively, in order to maintain blend price equivalence in their local markets even though milk in both locations may well be needed to the south of those locations. This position contradicts the fundamental purpose of establishing Class I differentials in order to encourage movement to where fluid milk is needed.

v. An inconsistent base differential. Proposal 19 is Inconsistent as to whether the proponents even think that the base differential should be raised. As the lead "umbrella" witness, Dr. Vitaliano suggested the base differential should be raised from $1.60 to $2.20. Hearing Exh. 299 at p. 5. But other proponents rejected that approach and did not include any change in the base differential for Nashville, Winchester, Virginia and Charleston, West Virginia, and only increased it by $0.15 in Clark County, Kentucky. This inconsistent approach pervades Proposal 19, notwithstanding that the base differential has always been a specific dollar amount applied uniformly throughout the order system.

vi. Inconsistent approaches to transportation cost data. Acting as NMPF's lead, "umbrella" witness, Dr. Vitaliano indicated during his testimony that Proposal 19 was conservative because the University of Wisconsin study (and Proposal 19 itself) utilized 2021 transportation cost data, even though 2022 or later transportation cost data would supposedly show higher transportation costs. But many subsequent proponent witnesses then proceeded in their own testimony to rely upon 2022 and 2023 transportation cost data as justification for Proposal 19, including in support of Class I differentials in excess

of those that the University of Wisconsin study itself supported. See the testimony of witness Zalar (Hearing Exh. 309) at p. 1 (discussing changes in hauling costs through 2023); p. 5 (discussing wage rates in 2022); p. 6 (diesel prices from Sept. 2022 through July 2023); witness Sims (Hearing Exh. 310) at p. 8 (2023 update of hauling costs); p. 11 (2023 fuel costs); witness Covington (Hearing Exh. 342) at p. 4 (diesel fuel costs through 2023 and the price of 2023 model and 2024 model milk tankers); witness Brinker (Hearing Exh. 356) at p. 2 (2022 transportation costs); witness John (Hearing Exh. 359) at p. 4 (January 2023 hauling rates).

Of equal concern, while acknowledging that the costs of transportation lay at the heart of the University of Wisconsin model, the proponents argued that the model does not account for traffic delays. Yet the proponents never provide a specific analysis of the dollar amount by which the study's transportation costs are allegedly understated for this reason. In other words, while Proposal 19 generally calls for Class I differentials higher than those identified by the University of Wisconsin study, when it comes to elements like traffic delays, the proponents fail to provide any analysis of the specific cost associated with that component.

vii. A refusal to allow the "fundamental determinants" of changes in milk supply locations and costs of transportation actually to play a role in setting Class I differentials. Dr. Nicholson, the USDSS model's co-developer, noted that during the nearly three decades since nationwide spatial values of milk have been systematically evaluated using the USDSS model, "there have been considerable changes to where milk is produced and where population growth has taken place. There have also been substantial changes to transportation costs. Milk supply, demand, and transportation

costs all have an impact on the spatial value of milk. The USDSS captures many aspects of these fundamental determinants of values in U.S. dairy supply chains to estimate spatial milk values that can inform the setting of Class I differentials." Hearing Exh. 303 at p. 7.

Yet many proponents abjured Class I differential changes that would reflect these new realities in the location and quantity of milk production and the impacts of higher transportation costs, demanding instead that the new differentials preserve existing relationships, although this principle was not uniformly applied as to areas such as Western Pennsylvania. Examples include witness Werme (Hearing Exh. 370) at p. 3 (setting Class I differentials at a level that would keep milk in Maine even though it is needed in Boston); identical pricing across long distances both the I-95 (Philadelphia to Washington, D.C.) and I-5 (from Canada to California) corridors; maintaining the same price relationship between the Shenandoah Valley and Tidewater, Virginia.

* * *

In short, much of the testimony presented was irrelevant to the question to be answered, and the Class I differentials that Proposal 19 proposes often do not reflect the salient considerations.

6. USDA should not raise Class I differentials in a misguided and doomed effort to reduce or eliminate depooling.

USDA should not adopt Proposal 19 under the misapprehension that its Class I differentials increases would reduce or eliminate depooling. Regardless of whether one regards depooling as good, bad, or neutral, the plain fact is that Proposal 19's increases in Class I differentials would have little effect on depooling, while resulting in the

substantial decline in fluid milk sales (and farmer receipts from those sales) that I have detailed in previous sections of my testimony. Raising Class I differentials with the intended goal of decreasing depooling would be a fool's errant.

Proof of this is set forth in Attachment C to this testimony. Attachment C identifies for each order those months from January 2020 through October 2023 in which depooling was realistic because the Class III or Class IV price exceeded the blend price. In those circumstances, the Class III or Class IV handler facing a higher class price than blend price would be incentivized to depool, be paid by its customer the higher class price (Class III or IV, as the case may be) and keep that money for itself rather than participating in the pool and only receiving the blend price.

The order with the largest amount of milk pooled over the past 10 years (2013-2022) was the Upper Midwest Order, Order 30. On the “Upper Midwest” tab in Attachment C, Columns C through P set forth the pool volume by class and total, utilization rate by class, and class prices, with Column Q setting forth the blend price. Out of the 46 total months between January 2020 and October 2023, there were 34 months in which either the Class III or Class IV price exceeded the blend price and depooling was therefore incentivized. These are shown in Column R of the “Upper Midwest” tab, with 34 months with exceedances denominated as “yes,” and 12 months with no exceedances denominated as “no.” Columns AC through AR of the Upper Midwest tab then repeat the same analysis, but this time assuming that the average Class I differential in the Upper Midwest Order has been increased by $1.26/cwt, as proposed in Proposal 19. Column AP shows that notwithstanding this $1.26/cwt increase in the Class I price, there remained 33 months in which either the Class III or Class IV price exceeded the blend price. These

are shown in Column R of the “Upper Midwest” spreadsheet with 33 months with exceedances denominated as “yes,” and 13 months with no exceedances denominated as “no.”

In other words, the proposed increase in the Class I differential only decreased by one month the number of months in which depooling was incentivized in the Upper Midwest order. Depooling was still incentivized in 33 months. The percentage of total months in which depooling was incentivized was only reduced by 2%, from 79% (34 out of 46) to 77% (33 out of 46).

This is a trivial impact and insufficient basis to support the adoption of Proposal 19.

The Northeast Order 1 tab is also quite illuminating. Column R of the Northeast Order tab shows that out of the 46 total months between January 2020 and October 2023, there were 16 months in which either the Class III or Class IV price exceeded the blend price and depooling was therefore incentivized. However, as the number of pounds pooled on the Northeast order shown in Columns C through G demonstrates, there was in fact no actual depooling in the Northeast Order in any month except for some partial depooling in June 2020. This is because the Northeast Order has adopted special rules that make it difficult for a depooled plant to rejoin the pool. So Northeast Order plants do not depool in the first place.

Whether the Northeast Order rules are good or bad is beyond the scope of this hearing. IDFA does not have a current position on whether other orders should adopt the same approach. But the example of the Northeast Order clearly indicates that if depooling

is deemed a sufficiently negative phenomenon, there are far more efficacious ways to deal with it than raising Class I differentials.

Indeed, if one wanted to raise Class I differentials sufficiently to increase the blend price to a level at which depooling would no longer be incentivized, we estimate that one would need to increase the average Class I differential in the Upper Midwest Order from its current $1.80/cwt in Cook County, Illinois to an unimaginable $25.39. It would only be at that point that the blend price in July 2000 would have exceeded the Class III price in that order.

* * *

My discussion to date addresses why Proposal 19 should be rejected in its entirety. I will now address some specific shortcomings in that Proposal, were USDA nonetheless to consider adopting any aspects of it.

7. There is no basis to increase Class I differentials in the three Southeastern orders, in light of the recent USDA decision to increase transportation credits and establish deliver credits in those orders.

Earlier this year, AMS held a FMMO hearing in Nashville, Tennessee to consider amending the transportation credit provisions of the Appalachian and Southeast orders and establishing distributing plant delivery credits in those two order and the Florida order. Subsequently, AMS on July 18, 2023 published a recommended decision, 88 Federal Register 46016, and a final decision was published in the Federal Register on December 1, 2023, 88 Federal Register 84038. Following a producer referendum, implementation is likely in early 2024.

The new decision, which at this point is subject only to referendum approval, both increases the existing transportation credits in two orders and adds for the first time new distributing plant delivery credits in all three orders.

Remarkably, the testimony and analysis in support of NMPF Proposal 19 barely even acknowledges, much less squarely addresses the significance of, these decisions. Granted, at the time the hearing commenced, there was only a recommended decision, but based upon past history, that recommended decision was overwhelmingly likely to be adopted in full with only small amendments, as has now happened. The underlying University of Wisconsin analysis that Proposal 19 started with but substantially modified did not reflect in any manner USDA's adoption of transportation credit increases, and creation of delivery credits, in the Appalachian, Florida, and Southeast orders. That is not intended as a criticism of the UW study, which significantly predated the July 2023 recommended decision and does not consider existing differentials in its model. But the impact of these credits need to be considered as part of evaluation of Proposal 19.

The USDA decisions significantly increases the amount of money Class I handlers must pay farmers and farmer organizations to bring sufficient supplies of milk to meet Class I needs, the very purpose also served by Class I differentials. Another witness will provide a detailed analysis of the impacts of the enhanced and new credits. The bottom line is as follows:

Current Credits vs. Combined New Transportation and Distributing Plant Delivery Credits ($/cwt)			
FMMO	**Current**	**New**	**Increase**
Order 5, Appalachian	$0.07	$0.90	$0.83
Order 6, Florida	none	$0.85	$0.85
Order 7, Southeast	$0.30	$1.10	$0.80

NMPF Proposal 19 would increase the county Class I differentials from between $1.10 and $2.70 per cwt.

NMPF Proposal #19 Class I Differential Increase from Current			
FMMO	**Minimum Increase**	**Average Increase**	**Maximum Increase**
Order 5, Appalachian	$1.40	$1.93	$2.70
Order 6, Florida	$1.50	$1.84	$2.00
Order 7, Southeast	$1.10	$1.91	$2.55

The transportation and delivery credit increase for the three Southeastern orders average between 42% and 46% of the NMPF Proposal 19 proposed increases in the Class I differentials in those orders:

Table 6 Increase in Credits for Orders 5, 6 and 7 versus NMPF Proposal 19			
FMMO	**New Transportation & Delivery Credit Increases**	**Average Proposal 19 Class I Differential Increase**	**Percent that the New Credits Represent of the Proposal 19 Class I Differential Increases**
Order 5, Appalachian	$0.83	$1.93	43%
Order 6, Florida	$0.85	$1.84	46%
Order 7, Southeast	$0.80	$1.91	42%

I want to be clear that **the transportation and delivery credit payment obligations are separate from, and on top of, Class I payment obligations in these three orders.** Some proponent testimony may have implied otherwise, suggesting that these credits are deducted when calculating Class I payment obligations or pool payment obligations. That is not correct.

8. Any proposed increase in Class I differentials should be offset by a $0.40/cwt decrease in Class I differentials because the $0.40/cwt Class I differential

component relating to the cost of becoming or maintaining a Grade A farm is both obsolete and inaccurate.

Milk for fluid milk purposes must be produced on a Grade A farm, per the requirements of the "Grade A Pasteurized Milk Ordinance" (the "PMO"), Hearing Exhibit 340, which sets forth "provisions governing the processing, packaging, and sale of Grade "A" milk and milk products." (p. iv). Among other things, the PMO sets forth various standards for a farm to be certified as a Grade A farm, a prerequisite to its milk being used for fluid milk purposes.

As I have already noted, the current Class I base differential of $1.60 is intended to reflect the additional costs relevant to serving Class I needs, above and beyond the costs necessary to serve dairy product needs in general. USDA, Milk in the New England and Other Marketing Areas; Proposed Rule on Proposed Amendments to Marketing Agreements and to Orders, 63 Federal Register 4802, 4908-09 (Jan. 30,1998). The current base Class I differential of $1.60/cwt includes a $0.40 component that purportedly reflects a farm's cost to achieve and maintain Grade A status, and paying that extra amount supposedly incentivized farmers to upgrade to Grade A. Id.

There are, however, many reasons why this component is obsolete. IDFA therefore submits that any increase in Class I differentials that USDA might otherwise entertain should be offset by a $0.40/cwt decrease.

a. Virtually all milk is now Grade A milk. In earlier times, only a fraction of milk produced in the United States was Grade A and eligible for fluid use. As recently as 1950 only 60% of U.S. milk sold was Grade A and eligible for fluid use. See USDA, Measure of Growth in Federal Orders, at p. 5 (May 17, 2023) (dividing the 1950 figure for "all milk"

by the figure for "fluid grade"), available at https://www.ams.usda.gov/sites/default/files/media/DairyMeasuresofGrowth19472022.pdf. In 1980, that percentage was still only 84%. See USDA, Statistical Reporting Service, Milk and Final Estimates for 1979-82 at p. 29, available at milkincomeest_Milk_-_Final_Estimates__1979-82.pdf (cornell.edu).

Today, by contrast, over 99% of all milk produced is Grade A milk, and in the vast majority of states, there is no Grade B milk whatsoever:

Milk Used and Marketed by Producers – States and United States: 2022

[May not add due to rounding]

State	Milk used where produced			Milk marketed by producers	
	Fed to calves [1]	Milk, cream, and butter	Total	Total [2]	Fluid grade [3]
	(million pounds)	(million pounds)	(million pounds)	(million pounds)	(percent)

- Represents zero.
(D) Withheld to avoid disclosing data for individual operations.
[1] Excludes milk sucked by calves.
[2] Milk sold to plants and dealers as whole milk and equivalent amounts of milk for cream. Includes milk produced by dealers' own herds and milk sold directly to consumers. Also includes milk produced by institutional herds.
[3] Percentage of milk sold that is eligible for fluid use (Grade A in most States). Includes fluid grade milk used in manufacturing dairy products.
[4] Other States includes Alaska and Hawaii.

USDA NASS, Milk Production, Disposition, and Income 2022 Summary (April 27, 2023) at p. 11, available at Publication | Milk Production, Disposition, and Income Annual Summary | ID: 4b29b5974 | USDA Economics, Statistics and Market Information System (cornell.edu).

Even those USDA numbers are understated, because much of the purportedly non-Grade A milk is California milk that farmers are designating as non-Grade A to avoid certain pooling or quota requirements; the milk is produced on farms that meet Grade A standards. My understanding is that California requirements relating to the physical characteristics of dairy farms are the same regardless of whether the farm is designated as Grade A.

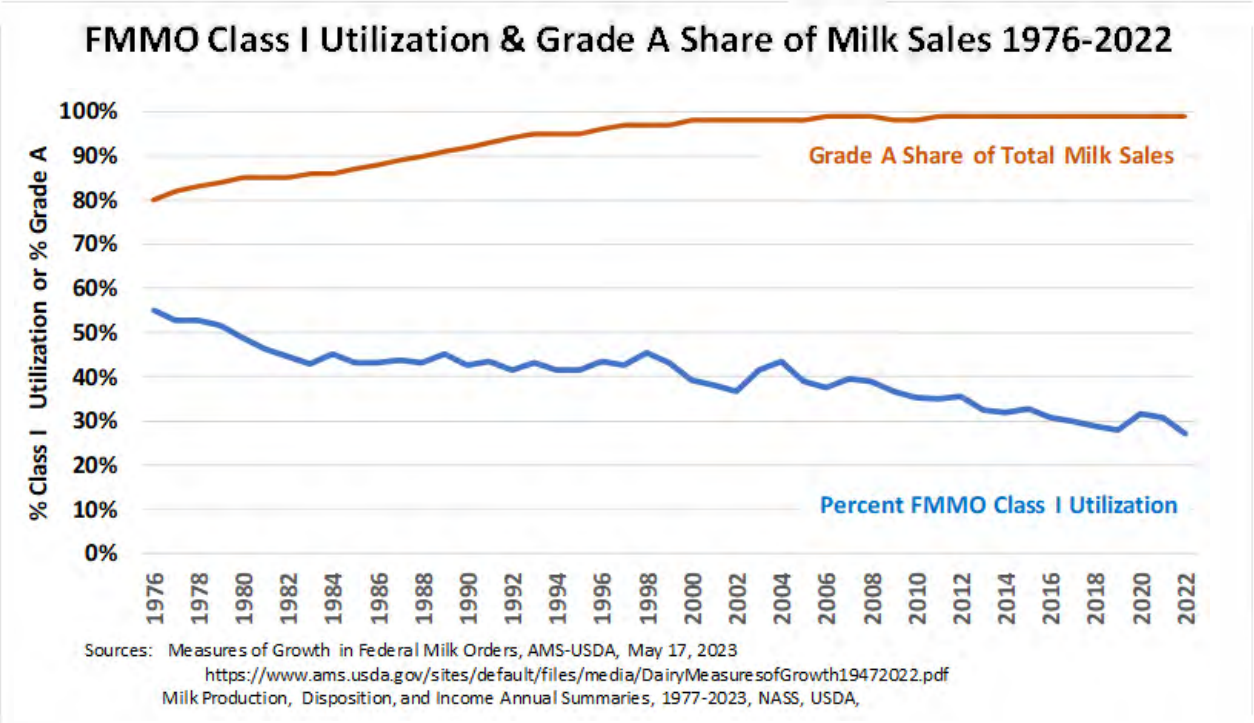
With 99% of all United States produced milk already being Grade A, there is obviously no longer any need to incentivize farmers to become Grade A. That battle has already been won and there is no need to keep producing grapeshot.

b. Milk has to be Grade A milk for many uses other than fluid milk. Furthermore, as noted, the original concept had been that the Class I differential should incorporate the cost of attaining and maintaining Grade A status because this was a special prerequisite tied to the farmer milk being used for fluid milk purposes. USDA, Milk in the New England and Other Marketing Areas; Proposed Rule on Proposed Amendments to Marketing Agreements and to Orders, 63 Federal Register 4802, 4908 (Jan. 30,1998) ("a portion of the Class I differential must reflect the value associated with maintaining Grade A milk supplies since this is the only milk available for fluid use").

Even if this were once true, it no longer is. Farmers now are Grade A for many reasons other than being able to serve fluid needs. There is accordingly no longer any reason to burden Class I milk with the cost of attaining Grade A status.

The fact that the increase in the percentage of milk that is Grade A milk is ***not*** tied in any way to its required use in fluid milk products can be readily discerned by plotting the percentage of milk that is Grade A against the percentage of milk that is Class I. If

the impetus for being Grade A was driven by the need for Class I milk to be Grade A, then the percentage of each should track each other over time. In fact, the percentage of milk that is Grade A has steadily risen (from 80% in 1976 to 99% in 2022) even as the percentage of FMMO milk that is Class I has steadily fallen (from 55% in 1976 to 27% in 2022):



The data underlying this chart is set forth in Attachment D.

In fact, many, many uses of milk other than Class I products require Grade A milk, either as a matter of law or customer demands.

First, the Pasteurized Milk Ordinance (PMO) itself defines Grade A milk products to include specific products other than fluid milk products, including cottage cheese and whey and whey products. Hearing Exhibit 240, at p. 8. The PMO on that page further defines Grade A products also to include all milk products with a standard of identity provided for in 21 Code of Federal Regulations Part 131 (excluding sweetened

condensed milk). This means that the following products must also be made using Grade A milk, even though many are not Class I products:

21 C.F.R. § 131.110	Milk.
§ 131.111	Acidified milk.
§ 131.112	Cultured milk.
§ 131.115	Concentrated milk.
§ 131.120	Sweetened condensed milk.
§ 131.125	Nonfat dry milk.
§ 131.127	Nonfat dry milk fortified with vitamins A and D.
§ 131.130	Evaporated milk.
§ 131.147	Dry whole milk.
§ 131.149	Dry cream.
§ 131.150	Heavy cream.
§ 131.155	Light cream.
§ 131.157	Light whipping cream.
§ 131.160	Sour cream.
§ 131.162	Acidified sour cream.
§ 131.170	Eggnog.
§ 131.180	Half-and-half.
§ 131.200	Yogurt.

Furthermore, many plants producing manufactured products, including for example cheese plants, end up with extra butterfat (cream). If they themselves use that cream to make packaged cream products, or sell the cream to customers that do so, then the plant's milk needs to have been Grade A milk, because as noted in the list above, packaged cream products must be made using Grade A milk.

Similarly, if the plant makes whey products that then go into a product that must be Grade A (such as yogurt), the whey must be made from Grade A milk.

Furthermore, many manufacturers of Grade AA butter require that their supply be Grade A, whether the milk comes directly from farmers or their cooperatives or from a manufacturing plant that has extra cream to sell.

The ubiquity of these reasons why farms must be Grade A, even though their milk is not destined for fluid consumption, can be readily demonstrated. The U.S. Food and

Drug Administration maintains the "Interstate Milk Shippers (IMS) List," which is a list of all--

> "[i]nterstate milk shippers who have been certified by Milk Sanitation Rating Officers (SROs) as having attained the identified milk sanitation compliance and enforcement ratings… These ratings/certifications are based on compliance with the requirements of the latest revision of the USPHS/FDA Grade "A" Pasteurized Milk Ordinance (PMO) and were made in accordance with the procedures set forth in the latest revision of the Methods of Making Sanitation Rating of Milk Shippers and the Certifications/Listings of Single Service Containers and/or Closures for Milk and/or Milk Products Manufacturers (MMSR).

https://www.fda.gov/food/federalstate-food-programs/interstate-milk-shippers-list#rules

In other words, to be on the IMS list means that the plant uses Grade A milk, per PMO requirements.

I have personally reviewed the current IMS list (which is available at Interstate Milk Shippers (IMS) List for Printing Archive | FDA) and identified at least 131 plants that primarily manufacture Class III and Class IV products. In other words, these plants use only Grade A milk, even though they are not fluid milk plants.

Many large plants are listed, including all of the large mozzarella plants (mozzarella being a low fat cheese product, these plants end up with extra cream to sell); the large Hilmar and Glanbia cheddar cheese plants (Hilmar and Glanbia being the country's largest cheddar cheese manufacturers); and to the best of my belief, all of the large butter-powder plants. My list of the 131 Grade A certified plants that primarily manufacture cheese, butter and dry milk products and appear on the IMS list is set forth in Attachment E to my testimony.

Furthermore, in addition to these 131 manufacturing plants, there also appear on Attachment E 1,748 Bulk Tank Unit (BTU) facilities that appear on the IMS list. A Bulk tank unit means a dairy farm or group of dairy farms from which raw milk is collected for pasteurization and for which a single entity sanitation compliance rating is issued. All dairies producing Grade A milk are members of a BTU.. FMMOs are restricted to suppliers of Grade A milk, so appearance on the IMS list is necessary to qualify the farmer milk being supplied to the manufacturing plant for participation in FMMO pools.

In short, there are many, many compelling reasons for the milk supply to be Grade A, as 99 plus percent of it is, going well beyond servicing the Class I market.

c. The costs of maintaining Grade A status are far less than $0.40/cwt. I have just explained why the cost of a farm attaining and maintaining Grade A status should no longer be included in setting Class I differentials because it is no longer a Class I issue. But even if there were some justification for doing that, the amount would be far less than $0.40/cwt.

While Mr. Erba attempted to quantify these costs, he was not familiar with the USDA guidelines establishing the requirements applicable to Grade B milk farms, see USDA AMS, "Milk for Manufacturing Purposes and its Production and Processing Recommended Requirements," available at Milk for Manufacturing Purposes and its Production and Processing | Agricultural Marketing Service (usda.gov). Without knowing those requirements, it is impossible to identify, and then quantify the costs, of the additional requirements that apply only to Grade A farms.

In addition, Mr. Erba cited certain physical facilities, such as restrooms, that are not required for either Grade B or Grade A status, and therefore should not be considered at all.

With over 99% of milk already having attained Grade A status for over 10 years– far in excess of the amount needed to supply Class I needs – the only possibly relevant consideration is the cost of maintaining Grade A status. Having consulted with others in the industry, I have only been able to identify two such costs:

1. The requirement that Grade A farms be inspected two times a year rather than one time a year.

2. The requirement that the barn walls with permeable surfaces be painted once a year.

Perhaps recognizing that the Grade A versus Grade B issue no longer aids their position, proponents have tried to switch the discussion to alleged requirements that some Class I processors have imposed that go beyond Grade A requirements. But now we are dealing with privately negotiated "extras," not mandatory requirements, and it is hard to see why those costs should be the subject of government mandate when the underlying requirements are not.

In any event, once again, these alleged additional costs are really not Class I specific. The requirement most frequently mentioned by the proponents is the requirement of some Class I processors that the milk supplied have somatic cell counts lower than the 750,000 cell limit imposed by the PMO. But there are at least two other reasons why farmers achieve such lower somatic cell counts that have nothing to do with fluid milk:

1. Many farmers supply milk to manufacturing facilities, including coop owned facilities, that participate in the export market. As confirmed during the testimony of Chris Hoeger (Prairie Farms), anyone exporting dairy products to any of 27 European countries must meet the European standard of a somatic cell count of no more than 400,000 somatic cell/ml.. See "Frequently Asked Questions (FAQ) AMS Dairy Program European Union Health Certificate Program (January 2022)," available at https://www.ams.usda.gov/sites/default/files/media/FrequentlyAskedQuestionsEUHealthCertificationProgram.pdf ("[T]he regulatory limit for somatic cells counts in milk is 750,000 cells/mL in the United States as established by the Pasteurized Milk Ordinance (PMO). …The regulatory limit for somatic cell counts in the EU is 400,000 cell/ml.)"

2. Lower somatic cell counts benefit any farmer seeking to maximize his or her milk production and cow health, at least as much as the processor seeking to produce the highest quality finished product. For example, reducing somatic cell counts from 400,000 to 200,000 increases milk production by 312 pounds per cow. See "Effect of Increased Somatic Cell Count on Herd Level Yield of Milk and Milk Components," Buckeye Dairy News Volume 19, Issue 5 at Table 3, available at https://dairy.osu.edu/newsletter/buckeye-dairy-news/volume-19-issue-5/effect-increased-somatic-cell-count-herd-level-yield

Milk SCC Data from the six Federal Orders with Somatic Cell Payments show that farmers understand the economic benefits of better cow health and have been very successful in maintaining low somatic cell counts in both high and low Class I utilization markets, with both cooler and hotter temperatures. The table below shows the somatic cell count averages over the past 5 years. All six of these orders have average cell counts

that are a fraction of both the EU limit of 400,000 and the FDA limit of 750,000 cells/ml. All average below 250,000 cells/ml. and three are under 200,000 cells/ml.

Averages for Federal Orders with Somatic Cell Count Programs, 2018-2022				
Order	Average SCC	Class I Utilization	Class I Milk	Total Milk
Appalachian	216	71.0%	320,435,162	451,546,891
Florida	232	82.9%	172,796,460	208,514,202
Southeast	240	70.0%	271,871,936	388,439,710
Upper Midwest	173	9.6%	217,260,718	2,261,676,939
Central	197	31.0%	380,783,333	1,230,146,815
Mideast	176	35.2%	539,583,339	1,532,144,118

Source: USDA Exhibit 44, Milk Components by Class and Order 2008-2023 YTD (Table 1)

There is no reason for fluid milk processors to bear the cost of this through the Class I differential.

ATTACHMENT A

DEPARTMENT OF AGRICULTURE
OFFICE OF THE SECRETARY
WASHINGTON, D.C. 20250

JAN 31 2003

The Honorable Don Sherwood
U. S. House of Representatives
1223 Longworth House Office Building
Washington, D.C. 20515-3810

Dear Congressman Sherwood:

Secretary Veneman asked me to respond to your letter of October 17, 2002, co-signed by several other members of Congress supporting a request for a hearing on a proposal submitted by Dairy Farmers of America (DFA) that would establish a "drought adjustment surcharge" on Class I and Class II prices.

USDA administers the Federal Milk Marketing Order (FMMO) Program. The objectives of the FMMO Program are to assure an adequate supply of milk for the fluid market and to create an orderly structure under which farmers can market milk year round – a structure which better balances the market power between dairy farmers and their cooperatives (the sellers) and milk handlers (the buyers). The FMMO Program is a marketing tool, not a price support program.

After reviewing the DFA proposal to add a surcharge to FMMO Class I and Class II prices to compensate farmers for additional feed costs brought on by drought conditions, USDA decided not to hold a hearing on the proposal. The bases for this decision are:

1. The proposal would result in higher prices for Class II raw milk that are not marketing-cost justified, which would likely result in Class II buyers substituting butter and nonfat dry milk (lower priced Class IV products) for Class II raw milk;

2. Adding a surcharge to Class I and Class II prices would provide substantially different benefits to farmers depending upon their location. For example, the farmers in the Florida FMMO, which has higher Class I utilization of about 90 percent, would benefit greatly from such a surcharge for milk used in Class I products. However, there would be substantially less benefit to producers marketing milk in the Upper Midwest FMMO where only about 20 percent of the milk is used in Class I;

3. The proposal would not provide any relief to dairy farmers who market milk outside the FMMO program, which is about 30 percent of the milk produced in the United States; and

4. USDA has recognized that the availability and prices of grains and forages have been a burden for some dairy farmers because of the drought. As a result, USDA has already taken action to provide assistance to those impacted. The USDA actions include:

   - Amending the Non-Insured Crop Disaster Assistance Program to implement the statutory elimination of the area loss requirement so that individual producers losses of forage produced for animal consumption are covered;

   - Providing $937 million for direct payments to assist livestock farmers affected by drought. This cash assistance was made available to farmers with livestock on a statewide basis in 7 States and to specified, hard hit counties in 30 other States. Dairy farmers in the designated drought areas who applied received $31.50 per cow and $13.50 per head of young stock for animals owned or leased as of June 1, 2002;

   - Establishing "Hay Net," a website for farmers to list the need for or the availability of hay;

   - Allowing the emergency haying and grazing of Conservation Reserve Program acreage; and

   - Taking steps to reduce the burdensome stocks of government-owned nonfat dry milk which are overhanging the market and delaying any milk price recovery.

We at USDA are aware of the financial stress facing the nation's farmers and are working to provide assistance through various programs. Again, thank you for writing to share your concerns on this important issue.

Sincerely,

Richard M. McKee
Deputy Administrator
Dairy Programs

ALL CHANNEL TRACKING: 2022 Update

The Projection of Milk Volume by Sales Channel

PRIME CONSULTING

May 2023

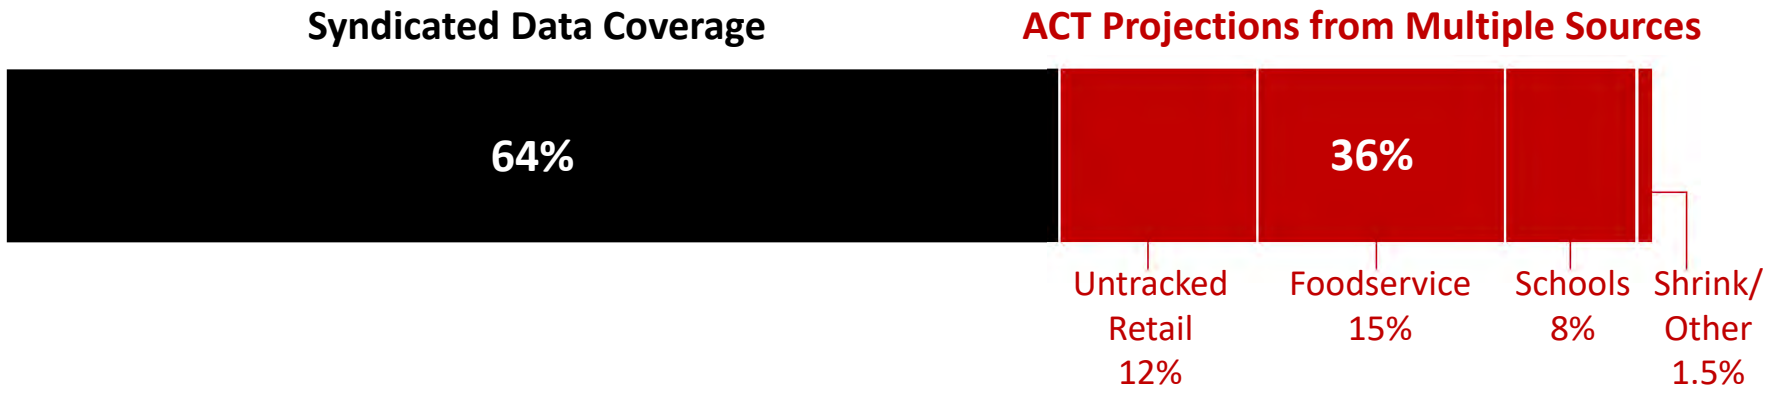
847.945.1155 ♦ www.primeconsulting.biz

Objective

MilkPEP and DMI engaged Prime Consulting to quantify projections of fluid milk sales in gallons for each major channel of distribution, along with growth trends from year to year.

This goes beyond the channels tracked by syndicated data providers. The syndicated data, which Circana (formerly IRI) calls “Multi-Outlet + Convenience” (MULO+C), now encompasses 64% of milk volume.

This report covers 100% of milk volume as reported by the USDA, and each channel/class of trade.



Scope & Approach: *Sources of Information*

Milk sales information was collected through confidential data sharing partnerships with 33+ companies.

Each participating processor provided Prime with access to confidential customer sales records. The contributing processors are listed on the following page. Collectively, the processor sample provided over 3 MM sales records covering over 500,000 retail, school and foodservice outlets.

Channels where processors make extensive use of distributors present a challenge, as the processor does not have end-customer visibility. For these channels/segments (primarily foodservice and smaller retailer outlets), Prime supplements processor sales data with independent channel projections using inputs from sources such as Technomic, NPD, trade associations, and various channel-specific publications.

In addition, a wide range of syndicated data was also used for appropriate channels. They are listed after the processor participation page.

The result is the most comprehensive collection of information and projections developed for the milk industry.

Since 2020, the school channel data collection changed to allow more visibility to Covid-19 driven interruption in instruction/feeding. This is detailed further in the school channel recap section.

33+ Contributing Companies*

Thank You to those who invested time and provided extensive access to customer and channel sales records, especially during the difficult operating environment brought about by the pandemic.

* A few additional contributing companies requested they be anonymous.

Information Sources Beyond Processor Sales Records

PRIMARY

- United States Department of Agriculture
  (AMS Reporting Service – Various Reports & Databases)
- Circana
  (InfoScan Multi-Outlet & C-Store Services)

SECONDARY

- Progressive Grocer
- Natural Foods Merchandiser
- Technomic
- National Restaurant Association
